                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC AAT47264-T47280 represent capped RNA molecules produced by the method of CC the invention. The method of the invention is for producing capped RNA or CC RNA analogues. The method comprises reacting a RNA or analogue CC oligonucleotide with a phosphate addition agent to form a RNA or analogue CC mono-, di- or triphosphate, which is then capped. The presence of the cap CC is important for mRNA maturation, initiation of translation, and protects is the mRNA against various RNases present in the cell. The capped RNA or CC preventing an influenza endonuclease aptamer, useful for treating or CC preventing an influenza infection in an animal. The synthetic capped RNA CC are substrates for virally encoded endonuclease associated with influenza CC virus. The short non-extendible (due to their length or because of the CC modification of the 3' end of the oligor RNA molecules are potent CC inhibitors of the cleavage of capped RNA by influenza endonuclease. They cap be used to investigate viral and cellular mechanisms of transcription/translation, or mRNA maturation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAT47264-T47280 represent capped RNA molecules produced by the method of the invention. The method of the invention is for producing capped RNA or RNA analogues. The method comprises reacting a RNA or analogue coligonuclectide with a phosphate addition agent to form a RNA or analogue mono, di- or triphosphate, which is then capped. The presence of the cap is important for mRNA maturation, initiation of translation, and protects the mRNA against various RNases present in the cell. The capped RNA or analogue is an influenza endonuclease aptamer, useful for treating or preventing an influenza endonuclease aptamer, useful for treating or preventing an influenza infection in an animal. The synthetic capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the inhibitors of the cleavage of capped RNA molecules are potent inhibitors of the cleavage of capped RNA by influenza endonuclease. They may be used to investigate viral and cellular mechanisms of
            Inter-Alu PCR was performed on YACs 905C2 and 763B11. Unpurified YAC DNA was amplified with generate primers Alu 5' (AAT63214) and Alu 3' (AAT63215). Genetic linkage strategies have placed a gene causing early onset Alzheimer's disease (AD) on the long arm of chromosome 14 between D14S289 and D14S61. The gene, S182 (see also AAT63207), was localised to a 100 kb region between D14S77 and D14S668E (see also AAT63216-22). A
                                                                                                                                                              New mutants of the S182 gene associated with familial Alzheimer's disease - and related protein and transgenic animals, useful as models for screening and assessing potential drugs.
                                                                                                                                                                                                                                                                                                                                                        18-JUL-1995;

                                                                                                                                      A method has been developed for detecting the presence or absence of a single nucleotide polymorphism (SNP) allele in a genomic sample. The method comprises preparing a reduced complexity genome (RCG) from the genomic sample and analysing the RCG for the presence or absence of a SNP allele. The method can be used to characterise a tumour, to generate a genomic pattern for an individual genome or to generate a genomic classification code for a genome. The method can be used to assess whether a subject is at risk for developing a disease or to identify a set of SNP alleles associated with a disease. The method can also be used to perform linkage analysis. AAA35944 to AAA35947 represent sequences used in the exemplification of the present invention. AAA35948 to AAA36632 represent nucleotide sequences containing SNPs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               families multiply affected by early onset

The methods can be used to detect the presence of genetic polymorphisms associated with inflammatory bowel disease and correlating their occurrence with disease states. They may be used in this way for phenotypic correlations, forensics, paternity testing, medicine and genetic analysis. The present sequence is a

                                                                                                                                                                                                                                                                      吊
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an inhibitor of apoptosis (IAP) antisense nucleic acid (I) that inhibits IAP biological activity, regardless of length of the antisense nucleic acid, the IAP proteins may be mouse or human XIAP, HIAP1 or HIAP2. Also included are a pharmaceutical composition comprising a mammalian IAP antisense molecule and a method of enhancing apoptosis in a cell, comprising administering a negative regulator of the IAP anti-apoptotic pathway to the cell. The IAP antisense inhibitor is useful for enhancing apoptosis in a cell in a matisense inhibitor is useful for enhancing apoptosis in a cell in a matisense inhibitor is useful for enhancing apoptosis in a cell in a mammal diagnosed with a proliferative disease. The method is useful for treating a patient diagnosed with a proliferative disease in the cancer. The IAP antisense molecule is useful to treat, ameliorate, improve, adenocarcinoma, lymphoma, pancreatic cancer,) and also in diseases or conditions where apoptosis is involved or implicated (e.g. embryonic devalues).
                                                                                                                                                                                                                                                                                                                                             Best Local Similarity Matches 17; Conserv

The STR marker 21-328 (informal designation) is useful as a marker for the diagnosis of aneuploidy of a chromosome, particularly trisomy 21, 13, 18 or X, or Turner Syndrome. The STR marker Y-408 (informal designation) is useful as a marker for the diagnosis of the sex of an individual. Marker CF508 is useful for detecting the presence or absence of a genetic disease, particularly cystic fibrosis. Sequences ABZ75621-22 represent PCR primers specific for the STR marker 21-32S
                                                                                                                                                                 Synthetic

The method of the invention is for producing capped RNA or CC RNA analogues. The method comprises reacting a RNA or analogue CC oligonuclectide with a phosphate addition agent to form a RNA or analogue CC mono- di- or triphosphate, which is then capped. The presence of the cap CC is important for mRNA maturation, initiation of translation, and protects CC the mRNA against various RNAses present in the cell. The capped RNA or CC analogue is an influenza endonuclease aptamer, useful for treating or CC preventing an influenza infection in an animal. The synthetic capped RNA CC are substrates for virally encoded endonuclease associated with influenza CC virus. The short non-extendible (due to their length or because of the CC modification of the 3' end of the oligo) RNA molecules are potent CC inhibitors of the clavage of capped RNA by influenza endonuclease. They cap be used to investigate viral and cellular mechanisms of transcription/translation, or mRNA maturation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁

The primers are used in the method of the invention. The specification describes a method for determining the predisposition of a human subject to develop autoimmune disease. The method comprises detecting a PMR sequence in the CD28, ICOS gene or CTLA4 gene of the human costimulatory receptor gene locus (hCGRL). PMR sequences vary in length among individuals and can be amplified to generate products that differ in size. These products can then be detected by rapid and convenient high resolution processes. The method is useful for determining the predisposition of insulin-dependent diabetes mellitus (IDDM), Addison's disease, Graves disease, autoimmune hypothyroidism, myasthenia gravis, thymoma, lupus, thyroiditis, postpartum thyroiditis, rheumatoid arthritis, Hashimoto's disease, coeliac disease and leprosy. PMR sequences within hCRGL are useful as markers in a variety of assays and in the field of forensic medicine, disease diagnosis and human genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  17-MAR-1999;
17-AUG-1999;
01-OCT-1999;
   This invention relates to 59 human secreted proteins and the nucleotide sequences encoding them. Sequences AAC59788-C59846 and AAB34687-B34745
                                                                                                                                                           Novel proteins and polypeptides useful for the treatment of e.g multiple sclerosis, systemic lupus erythmatosus, rheumatoid arthritis, cancer, Alzheimer's disease, Parkinson's disease, stroke, anemia and ulcers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Secreted protein; human; autoimmune disorder; multiple sclerosis; ulcer; systemic lupus erythematosus; rheumatoid arthritis; anaemia; stroke; haematopoiesis regulation; tissue regrowth; wound healing; haemophilia; hlzheimer s disease; Parkinson's disease; Shy-drager syndrome; cancer; contraceptive; infection; growth inhibition; hyperproliferative disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Oligonucleotide probe for human DNA clone vq9 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAC59889 standard; DNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 20

Probes for the DNA sequences are represented by sequences AAC5947-C59596. The continuing and their proteins exhibit neuroprotective, dermatological, immunosuppressive, cantifinal ammatory, antianaemic, nootropic, antiparkinsonian, cerebroprotective, haemostatic, voltropic, antiparkinsonian, creating to in research. The proteins are useful as mutritional sources or supplements and contracters, which may be genetic or resulting from infections, autoimmune disorders such as multiple sclerosis, systemic lupus erythmatosus, creating architists, and for treating myeloid or lymphoid cell conformers such as anaemias by regulating from undersis. The proteins are also useful in compositions for bone, cartilage, tendon, ligament can are also useful in compositions for bone, cartilage, tendon, ligament can are also useful in compositions for bone, cartilage, tendon, ligament can are also useful in the treatment of central and peripheral conformers include in the treatment of contral and peripheral conformers and shy-Drager syndrome, and mechanical and traumatic disorders, such as spinal cord disorders, head trauma and stroke. The proteins may conclude for inhibiting the growth, infection or function of, or killing, infections agents such as bacteria, virus, fungi and other parasites, for effecting biorhythms or cardiac cycles or rhythms, effecting metabolism, effecting behavioural characteristics, providing analgesic effects and cathabolism, processing, utilization, storage or elimination of contracting behavioural characteristics, providing analgesic effects and contractine disorders such as period as periodical characteristics, providing analgesic effects and contractine disorders such as periodical effects and contractine disorders

Primers for synthesising the full length cDNA are useful length clones were obtained by construction of the protein encoded by the cDNA. The full libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a primer used to amplify a human cDNA clone provided in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           830\ \text{Primers} useful for synthesizing full length cDNA clones and their in genetic manipulation.
                      The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranslated region, 1776-1806 of the translation termination codon region or 1818-2370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro. The hyperproliferative disorder includes cancer or psoriasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 18; Page 127; 1380pp +

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
The present invention relates to antisense compounds, 8-30 nucleobases in CC length targeted to the 5' untranslated region, translation termination CC codon region, 3' untranslated region, coding region or translation start CC site of a nucleic acid encoding human mdm2 where the antisense compound CC modulates the expression of human mdm2. The antisense oligonucleotides of the invention are useful for encoding human mdm2 and for inhibiting the CC expression of human mdm2. They may be used for treating an animal having CC adisease or condition associated with amplification of mdm2 gene or CC (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis, fibrosis, atheroselerosis or restenosis, tumours, colorectal carcinoma CC and chronic myelogenous leukemia. The antisense compound may be administered with a chemotherapeutic agent to overcome drug resistance. CC The antisense compound reduces hyperproliferation of human cells. The method, which involves the use of the antisense compound, is also useful CC method, which involves the use of the antisense compound, is also useful

         This invention relates to the CDNA and protein sequences of novel proteins HYPLIP1 or FCHII and to sequence variations within these genes that have been shown to be associated with lipid disorders.

Chat have been shown to be associated with lipid disorders.

Coligonucleotide probes that hybridise to the CDNA sequence are useful for analysing the expression of FCHII by detecting the expression of the mRNA transformed with the CDNA of the invention is useful for producing the protein by recombinant means.

Charlest in the sample. A host cell transformed with the CDNA of the invention are useful for producing the protein by recombinant means.

Charlest in the sample and the sequence of the invention are useful for treating or preventing a lipid disorder associated with expression of FCHII such as familial combined hyperlipidaemia, coronary are useful for treating or preventing a lipid disorder associated with hyperapobetalipoproteinaemia, hypertriglyceridaemia, familial dyslipidaemic hypertension, syndrome X, obesity, insulin resistance and hypercholesterolaemia. The cDNA sequence is useful in the diagnosis or prognosis of predisposition to lipid disorders and cancers, and also to identify a molecule which enhances or decreases the HYPLIP1 or FCHII activity. The prosent sequence represents an oligonucleotide primer activity. The prosent sequence represents an intention The mouse HypLIP1 locus of the intention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Best Local Similarity Matches 17; Conserv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                    The present invention describes a method of arraying genome clones. The CC method comprises: (a) clones of the genomic libraries contained in CC multiwell plates numbered for discrimination are mixed in each of the CC multiwell plates; (b) a primer designed based on the chromosome marker (c) a signal corresponding to the maxture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant cC mplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order cc of the maximum in the specified discrimination Nos. to array the multiwell cc plates; (e) the clones in the multiwell plates of the specified cd discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the cc resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified by using the above primer; (g) signals are detected from the detected result; and (i) the clones are mixed respectively. The clones in the multiwell plates are specified from the detected result; and (i) the clones are constituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent CC specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ś

                                                                                                                                                                                                     The invention relates to an isolated polynucleotide comprising a sequence variation of a mouse HYPLIP1 cDNA or a human FCHL1 (familial combined hyperlipidaemia) gene. The FCHL1 polynucleotide, the FCHL1 polypeptide or antibody immunoreactive to the FCHL1 polypeptide are useful for treating or preventing cancer associated with expression of FCHL1, as well as for treating lipid disorder. The mouse HYPLIP1 cDNA or human FCHL1 gene are also useful for diagnosing or prognosing a predisposition to lipid disorder and cancer. ABK70902-ABK71303 represent mouse HYPLIP1, human FCHL1 coding sequences and PCR primers of the invention
                                                                                                                                                                                                                                                                                                              New mouse HYPLIP1 and human FCHL1 (familial genes and their sequence variations, useful preventing lipid disorders and cancers.

                                                                                                                                                                                                          The invention relates to antisense compounds, composition and methods for modulating the expression of human interferon gamma receptor 2 (IFNGR2). The compositions comprise antisense compounds targetted to nucleic acids encoding IFNGR2. Antisense compounds of the invention are useful for treating diseases or conditions associated with IFNGR2, e.g. autoimmune disorder (e.g. autoimmune thyroiditis, diabetes, multiple sclerosis, autoimmune arthritis, autoimmune insulinitis or Crohn's disease), cancer, or a disease/disorder caused by aberrant apoptosis. They are also useful for diagnostics, therapeutics, prophylaxis or as research reagents or kits. The invention is useful in gene therapy. The present sequence is an antisense oligonucleotide targetted to human IFNGR2 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ##;

CCDNA sequence, mouse HYPLIP1 genomic DNA, or the homologous human control the sequence is associated with a lipid disorder. Also claimed is an isolated polypeptide comprising a variant form of the mouse HYPLIP1 amino caid sequence, where the variant is associated with the lipid disorder. Also claimed is an cid sequence, where the variant is associated with the lipid disorder, an isolated polynucleotide having at least 12 contiguous nucleotides of the isolated polynucleotides, where the 12 contiguous nucleotides span caids of the encode polypeptides, where the 4 contiguous amino caids of the encode polypeptides, where the 4 contiguous amino caids span the variation position, a kit for the detection of the FCHLI cous comprising, an isolated antibody, identifying susceptibility to a lipid disorder which comprises comparing the nucleotide sequence of the suspected FCHLI allele with a wild-type FCHLI nucleotide sequence, where the difference between the suspected allele and the wild-type sequence identifies an altered HYPLIPI or FCHLI nucleotide sequence and a composition. Also disclosed is a transgenic animal which carries an altered hyPLIPI or FCHLI allele and a method for screening cand antibodies are useful for treation of FCHLI gene function as an anti-

card antibodies are useful for treation or reventing (e.g. gene therapy)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   allele; anti-lipid disorder; anti-cancer therapy; gene therapy; familial combined hyperlipidaemia; coronary artery disease; atherogenic lipoprotein phenotype; hyperapobetalipoproteinaemia; hyperrriglyceridaemia; low density lipoprotein subclass B; LDL; familial dyslipidemic hypertension; syndrome X; hypercholesterolaemia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel isolated polynucleotide comprising a mouse or human familial combined hyperlipidemia 1 gene having a variation that is associated a lipid disorder, useful for identifying susceptibility to the lipid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mouse HYPLIP1 locus
                                                                 and antibodies are useful for treating or preventing (e.g. gene therapy) a lipid disorder associated with expression of FCHIL, for diagnosis or prognosis of predisposition to lipid disorder, and cancer and for treating a lipid disorder such as familial combined hyperlipidaemia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   07-SEP-2001; 2001US-00949428
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        US2003064372-A1
             coronary artery disease, atherogenic lipoprotein phenotype, hyperapobetalipoproteinaemia, hypertriglyceridaemia, low density lipoprotein (LDL) subclass B, familial dyslipidemic hypertension.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 11;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ព្រះ្តន
      The invention describes an isolated polypeptide (I) comprising a variant of form of a mouse HYPLIPI polypeptide sequence (SI) or a human FCHLI representation, where the variant form is associated with cancer, or an amino acid sequence having at least 65 % sequence identify to (SI) or (S2). A composition comprising DNA encoding (I) is useful for treating or preventing cancer associated with expression of FCHL1. FCHL1 gene or HYPLIP1 gene and its product are useful for the study of metabolic pathway and cellular mechanism to identify other genes, receptors and relationships that contribute to lipid disorder and cancer. FCHL1 gene or its fragments are useful in gene therapy to increase the amount of the expression products of the gene for the treatment of lipid disorder or cancerous cells. The sequence variation of FCHH1 gene or HYPLIP1 gene is also useful in the diagnosis and prognosis of predisposition to lipid disorder and cancer. Antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The sequence presented is a PCR primer which was used to amplify part of the mouse {\tt HYPLIP1} locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               US2003054418-A1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                         The invention comprises antisense oligonucleotides which are targeted to the human mdm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonucleotide of the invention. The present sequence contains 2'-methoxy-residues and has a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antisense oligonucleotide; human; mdm2; hyperproliferation; hyperproliferative disorder; cancer; psoriasis; fibrosis; atherosclerosis; restenosis; apoptosis modulation; p21; ss; 2'-methoxy-residue; phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   expression used in the
                                                                                                                                                                                                                                                                               Novel antisense compound targeted to 5' untranslated region, coding region, or intron:exon junction of nucleic acid molecule encoding mdm2, useful for treating e.g. cancer, psoriasis or restenosis by inhibiting

The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory, steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an composition genstivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of bully unione or CC lung inflammation, lung allergies, or a respiratory disease or condition. CC Note: The sequence data for this patent is not represented in the printed captification, but was obtained in electronic format directly from WIPO care from which was obtained in electronic format directly from WIPO care from which was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nyce Ji
Miller

                                                                                                                                                                                   The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an antisense gene therapy. The composition or depleting levels of or reducing sensitivity to adenosine, reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine CC lung surfactant in a subject, for reducing levels of deenosine CC lung surfactant in a subject's tissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition. CC specification, but was obtained in electronic format directly from WIPO or at firm wino inflamble and recomposed.

                                                                                 The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the cinitiation codon, coding region, 5' or 3' end genomic flanking regions, CC initiation codon, coding agion, 5' or 3' end genomic flanking regions, CC initiation codon, coding a polypeptide associated with lung and/or coding a polypeptide associated with lung and/or compassition of the invention and a second active agent comprising an cc antiinflammatory steroid and ubiquinone. A composition of the invention cc has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also cf or enhancing the prophylactic or therapeutic respiratory effect of an cantiinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, increasing levels of ubiquinone or condition.

CC oligonucleotides are derived from a gene encoding or regulating mRNA.

CC expression of a target polypeptide associated with lung airway or lung conversion of a cancer and can be anti-sense to the corresponding mRNA.

CC The invention also describes a kit, that comprises: (a) a delivery constructions for adding a carrier and for use of the kit. The composition of instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analysis of the addington composition of the kit. The composition of treating a respiratory, lung or malignant disease. The administered composition respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The compliance the administered conformation, allergies and/or bronchoconstriction and/or lung confilammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vascoonstriction, confilammation, emphysema, chronic obstructive pulmonary disease, pulmonary contents of the reduced adenosine content of the anti-sense oligos corresponding to the reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system of the oligonucleotides into products that free adenosine into the system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; antisense; bronchocoustituturi, lung; cancer; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; sartiactant depletion; antiallergic; antiinflammatory; actiofibrosis; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distracts syndrome; allergic rhinitis; pulmonary hypertension; respiratory distractive pulmonary disease; cancer; bronchitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
CC composition of igonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating composition, respiratory tract inflammation, allergies and composition adenosine sensitivity, levels of adenosine (A) or (A) receptors, composition or hyposecretion, when administered to a mammal. The collipse are derived from a gene encoding or regulating composition of a target polypeptide associated with lung airway or lung composition also describes a kit, that comprises: (a) a delivery composition also describes a kit, that comprises: (a) a delivery composition is eparate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, compassing a respiratory, immunosuppressive and cytostatic activity, is a beta adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition composition composition and is administered to reduce the production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhintits, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 20
       This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) recepto
                                                                                                                                                                                                                                                                            Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            N58473-derived oligonucleotide SEQ ID 7959.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              31-OCT-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC oligonuclectides are derived from a gene encoding or regulating CC expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition CC of the invention has antiallergic, antiinflammatory, antiasthmatic, CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered CC composition comprises oligo and is administered to reduce the production cor availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The CC inflammation, allergies and/or bronchoconstriction and/or lung conflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, conflammation, emphysema, chronic obstructive pulmonary disease, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to an oligonucleotide anti-sense to e.g., cc initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-cc end of nucleic acid target comprising gene(s) chosen from e.g. cc interleukin (IJ)-4 receptor, IL-5 receptor or salts of the coligonucleotide and optionally surfactant operatively linked to the coligonucleotide. The method is useful for preventing or treating a cc oligonucleotide. The method is useful for preventing or treating a cc of a subject an effective amount of an inhibitor. The oligonucleotide is cc useful for production of a medicament for the prevention and/or treatment cc of a respiratory or lung disease. The respiratory or lung disease is cc chosen from airway inflammation, allergy(ies), asthma, impeded cc respiration, cystic fibrosis (EC), chronic obstructive pulmonary diseases (CODD), allergic rhinitis (AR), acute respiratory distress syndrome cc (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway construction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

target molecules in the field of medicine, and in particular genes
encoding proteins that are associated with signal transduction,
glycoproteins and transcription. The present invention describes a method
for efficiently cloning a full length human cDNA from both the 5' and 3'
ends using the oligo-capping method. This oligonucleotide sequence is a
human clone specific PCR primer used in an exemplification of the
         This invention relates to a novel antisense compounds that modulate the expression of isoprenylcysteine carboxyl methyltransferase (also known as ICMT, PCCMT, pcMTase, PPMT, PPMTase, HSTE14, MST098 and MST098) and located on chromosome 1p36. Specifically, it refers to compositions useful for inhibiting the expression of isoprenylcysteine carboxyl methyltransferase, which normally participates in cellular events such as growth factor signal transduction, cell replication, vesicular transport and the post-translational modification of the Ras family of GTPases. The present invention describes antisense oligonucleotides that comprise at least one modified sugar moiety, a 2'-O-methoxyethyl (2' MOE) and at least one modified mucleobase, a 5-methylcytosine. Accordingly, these compounds are useful for treating a disease or condition associated with

This invention relates to a novel antisense compounds that modulate the expression of isoprenylcysteine carboxyl methyltransferase (also known as ICMT, pCCMT, pCMTase, PPMT, pPMTase, HSTE14, MST098 and MSTP098) and CC located on chromosome 1936. Specifically, it refers to compositions cuseful for inhibiting the expression of isoprenylcysteine carboxyl cystein factor signal transduction, cell replication, vesicular transport cystem factor signal transduction, cell replication, vesicular transport cystes and the post-translational modification of the Ras family of GTPases. The present invention describes antisense oligonucleotides that comprise at CC least one modified sugar moiety, a 2-O-methoxyethyl (2', MOE) and at CC compounds are useful for treating a disease or condition associated with isoprenylcysteine carboxyl methyltransferase such as a hyperproliferative CC disorder (e.g. cancer), an inflammatory condition, hypertension or CC cardiovascular disease. As such, they exhibit cytostatic, antiinflammatory, hypotensive and cardiant activities and are useful for research reagents and in diagnostics. This oligonucleotide sequence is a phosphorothioate antisense DNA oligo used to modulate human carboxyl methyltransferase expression in an
                                                                                                                                    Matches

The CC human mpGES-1 gene is located on chromosome 9, more specifically to CC 9334.3. The present invention also describes: (1) antisense compounds, CC mpGES-1, which specifically hybridise with the nucleic acid encoding CC mpGES-1, which specifically hybridise with the nucleic acid mpGES-1 and CC mpGES-1 in cells or tissues; and (3) a method of treating an animal CC maying a disease or condition associated with mpGES-1. MpGES-1 chimeric CC antisense oligonucleotides and antisense compounds have cytostatic, CC antidiabetic, immunomodulator, cardiant, neuroprotective, antiarthritic, vasotropic, CC ophthalmological, immunomodulatory and cardiovascular activities, and can be used for preparing a composition for treating a disease or CC condition associated with mpGES-1 a disease or CC condition associated with mpGES-1 and can be used for preparing a composition for treating a disease or CC condition associated with mpGES-1 e.g., inflammation, Alzheimer's CC disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ś

                                                                                                                                                                                CC codon, coding region, 5' or 3' intron-exon junction, intron or region cod with 2-10 nucleotides of the 5' end or 3' end of a nucleic acid target chosen from a gene encoding interleukin (II) 4 receptor, interleukin (II) 6-5 receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention compounds that binds to one or more nucleic acid target(s) or expressed product(s), for the compound encoding interleukin or expressed product(s), for the coligonucleotides are useful for reducing or inhibiting expression of a coligonucleotides are useful for reducing or inhibiting expression of a coligonucleotides are useful for reducing or inhibiting expression of a coligonucleotides are useful for reducing or inhibiting expression of a compound that binds to coligonucleotides are useful for preventing or treating or inhibiting expression of a compound that binds to coligonucleotides are useful for preventing or treating or inhibiting expression of a conspiratory or lung disease is associated with hyper-responsiveness to compound that binds are compound that binds are compound that binds are conspiratory or lung disease to inflammation or an inflammatory disease. The respiratory or lung disease to compound that and/or inflammation, allergy, asthma, impeded respiration, constitution or an inflammation, bronchitis, airway obstruction or invention or compound inflammation, bronchitis, airway obstruction or invention. This sequence represents an oligonucleotide of the invention.
                                                                Matches
                                                                                                 Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nyce JW, Sandrasagra A, Shahabuddin S, Lu H, C

The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human glycoprotein VI (platelet) (GP6; GPIV;GPVI) DNA which is located at chromosomal position 19q13.4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying a subject at risk of breast cancer by detecting or absence of one or more nucleotide polymorphic variations, diagnosing, preventing and/or treating breast cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Roth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              single nucleotide polymorphism.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel method for identifying a subject at risk of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human chromograpin B (CHG); secretogranin

CC MMSC1 protein. The PCR templates were derived from tumour cell lines, and CC MMSC1 protein. The PCR templates were derived from tumour cell lines, and CC the amplicons were tested for mutations. The MMSC1 protein is a MMAC1 CC interacting protein which is involved in tumour suppression activity in CC the MMAC1 pathway. MMSC1, antigenic fragments or fusion proteins of these CC are used as immunogens for antibody production. Primers derived from CC MMSC1 genomic clones can be used for identification of MMSC1 genes and CC for synthesis by amplification of MMSC1 DNA or RNA. Detecting an CC alteration in MMSC1 can be used to diagnose cancer. A germline alteration CC in an MMSC1 gene is indicative of a predisposition to cancer. A somatic CC contaction in an MMSC1 gene is indicative that the tissue is cancerous. CC interactions can be used for detection of alterations in MMAC1 associated CC with cancer. Wild-type MMSC1 or a homologue can be used to supply wild-cype MMSC1 gene function (or a substantially similar function) to a cell, which has lost the gene function due to a MMSC1 gene mutation. The gene CC suppresses neoplastic growth of the cell. Transgenic animals having an CC useful in treating cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 1272

includes kits for determining the presence or absence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or CC identity of a SNP and for genotyping nucleic acid samples for e.g. to cases by association analysis the genotype of an individual or group of CC individuals, having a pathological phenotypic trait suspected of being CC caused by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC dystrophy, familial hypercholesterolaemia, polycystic kidney disease, cC craits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune CC disease of which a component is or may be genetic such as autoimmune concerning including, rheumatoid arthritis, multiple sclerosis, concerning the method is also useful in forensic investigations and conternity analysis. The present sequence represents a PCR primer specific for a human SNP containing DNA sequence

Sequences AAF23420 - AAF23450 represent primers and probes used in the isolation and characterisation of the SECX DNA sequences of the invention. The new polypeptides and nucleic acids can be used in screening assays, detection assays, preventive or predictive medicine, therapeutic and prophylactic treatment, and pharmacogenomics. Specifically, the SECX polypeptides and nucleic acids are useful for treating cancer; other disorders related to angiogenesis e.g. abnormal wound healing, psoriasis; neurodegenerative diseases; immune disorders; liver cirrhosis; benign tumours; fibrocystic conditions and tissue hypertrophy (e.g. benign prostatic hypertrophy); allergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; single nucleotide polymorphism; SNP; genome; gene therapy; protein therapy; vaccine; probe; diagnostic assay; detection; quantitation; restorative therapy; polymorphic; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        parasites, and as a vaccine. SECX antibodies may be used to isolate or detect SECX proteins, monitor protein level in tissue as part of a clinical testing procedure, treat proliferative disorders including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 reactions and conditions such as asthma and other respiratory problems; as well as in treating or preventing diseases associated with organ transplantation, atherosclerosis-associated diseases or disorders. The polypeptides can also be used for bone, cartilage, tendon, ligament and/or tissue growth or regeneration, wound healing, tissue repair and replacement, gut protection or regeneration, as a contraceptive, to inhibit thromboses, infections caused by bacteria, virus, fungi and other inhibit thromboses, infections caused by bacteria, virus, fungi and other inhibit thromboses.
   AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53329 represent peptides related to human polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          09-NOV-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 21 BP; 4 A; 7 C; 5 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC thermapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC example, (I) may be used to treat disorders by rectifying mutations or CC deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own CC production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CC therefore which patients may be in need of restorative therapy. The CC polypeptides encoded by (I) may be used as antigens in the production of CC antibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic CC polypeptides in samples

                                         The sequence is that of a primer specific for the D9S58 marker polymorphism which may be used in the detection of a gene associated with familial dysautonomia (FD). It may be used in a test kit for screening of foetuses and individuals at risk through their family. (Updated on 25-MAR

These primers map to the 5'region or the exons of the AGT gene. The amplified products are analysed by single stranded conformation polymorphisms (SSCP) to identify any differences which were then sequenced and compared to the normal gene. These primers can especially be used to determine a predisposition to essential hypertension or pregnancy-induced hypertension. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         primer; polymerase chain reaction; PCR; amplify; angiotens:

                                                                                                                                      Primers T41001-T41382 are derived from novel human gene signature (GS) sequences which did not match with sequences deposited in Genbank release 76. The GS sequences (T19001-T26837) were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types. The primers T41147-8 amplify clone pm0368 which comprises the GS HUMGS001308 (T20308), located on chromosome 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gene signature; messenger RNA; mRNA; relative abundance; frequency; human; cloning; mapping; non-biased library; diagnosis; detection; cell typing; abnormal cell function; primer; PCR; amplification;
                                                                                                                                                                                                                                                                                                                                                            Single-stranded DNA for identifying gene signatures - isolated from 3'-directed human cDNA library that reflects relative abundance of corresp. mRNA in specific human tissues.

                                                                                                                                                                                                                                                                                                                                                                                                                                                    4 Kindred families provided genetic evidence for localisation of the human cancer predisposing gene, BRCA1 (see AAT18310), to a sufficiently small region of 17q for the appln. of positional cloning strategies. 15 short tandem repeat markers assayable by PCR were used to refine this localisation. Primer sequences for 4 of these markers were AAT18315-16 for DS178754, AAT18317-18 for DS178975, AAT18319-20 for tdj1474, and AAT18312-22 for tdj1239. The region contg. BRCA1 was estimated to be approx. 650 kb and to be flanked by tdj1474 and U5R
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Skolnick MH, Goldge

                                                                                                                  can be used as immunogens for antibody production. The mutant BRCA1 genes have at least 1 mutation or polymorphism in comparison to the wild type BRCA1 sequence. By detecting a germline alteration in the BRCA1 gene, a predisposition for breast and ovarian cancer can be diagnosed. In one method, BRCA1 mRNA isolated from a tissue sample from a subject has a probe, corresponding to a fragment of the BRCA1 sequence (or an allelespecific probe for a mutation of it), added to it. The conditions allow for hybridisation of the probe to the mRNA, and any hybridisation which occurs is detected. Alternatively the BRCA1 gene in the tissue sample is isolated, and a shift in electrophoretic mobility of single stranded DNA from the sample on a non-denaturing polyacrylamide gel indicates a mutation. These methods of detection can also diagnose a lesion neoplasia associated with the BRCA1 locus. The methods may be used in gene therapy, protein replacement therapy and protein mimetics, and may be used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cancer therapy; breast and ovarian cancer predisposing gene; immunogen; antibody production; germline alteration; probe; lesion neoplasia; huma gene therapy; protein replacement therapy; protein mimetic; BRCA1; PCR; polymerase chain reaction; primer; amplify; tandem repeat; 88.
                                                                                                                                                                                                                                                                                                                                                                   AAT17531-T17538 represent amplification primers for tandem repeat markers in the cDNA of the human breast and ovarian cancer predisposing gene (BRCA1) (see AAT17438 for cDNA sequence, and AAT17530 for genomic sequence). This sequence is used in conjuncture with AAT17538 to amplify the short tandem repeat tdj1239. These primers were used in mapping the BRCA1 gene, and for isolating mutations in it. Proteins encoded by mutations of the BRCA1 sequence (see AAT17439-T17453 and AAT17455-T17529) mutations of the BRCA1 sequence (see AAT17439-T17453 and AAT17455-T17529)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        02-SEP-1994;

The primers AAT32602-9 were used to generate a refined physical map of the region surrounding the BRCA1 gene. Esp. the primers AAT32602-3 amplify marker D8178754, AAT32604-5 amplify marker D8178975, AAT32606-7 amplify marker tdj1474 and AAT32608-9 amplify marker tdj1239. The results of the map show that the BRCA1 gene lies between the markers tdj1474 and U5R, an estimated distance of 650 kb. Isolation of the BRCA1 gene, (AAT32601) has allowed development of methods to diagnose a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        p120 is a 120 kD nucleolar antigen protein that is associated with cell proliferation and growth. AAR99630-41 are oligonucleotides antisense to regions of the human p120 gene, that were created and tested for the ability to inhibit the production of p120 and tumour cell growth. These oligonucleotides failed to inhibit p120 production but some did have an effect on tumour cell growth (Hela 33 cells). Other oligonucleotides antisense to the 3'UTR of the p120 gene (see AAT89628 and AAT89629) did inhibit p120 production and the growth of tumour cells in vitro and in vivo. These may be used to treat malignancies, especially human breast cell carcinoma, human epithelioid cervix carcinoma, human amelanotic melanoma and human renal cell carcinoma, and other hyperproliferative of the seasons are informative and cardinoma, and other hyperproliferative of the seasons are first arms of cardinoma, and other hyperproliferative of the seasons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antisense; p120; proliferation associated protein; inhibition; UTR; untranslated region; hyperproliferative; cancer; neoplasia; tumour; malignant; carcinoma; melanoma; cardiovascular; inflammation; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides a method for sulphurising phosphorus-containing compounds. It comprises contacting the phosphorus-containing compound which a 1,2,4-dithiazolidine-2,5-dione compound or a 3-substituted-1,2,4-dithiazolin-5-one compound. The method is especially useful for incorporation of phosphorothioate linkages into biologically important molecules such as DNA, RNA and phosphopeptides. Molecules containing such linkages are useful e.g. as antisense compounds for inhibiting gene expression, as reagents for studying DNA-protein or RNA-protein interactions, or as catalytic RNA. The present sequence represents an oligonucleotide with phosphorothioate linkages prepared by the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         misc_feature
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sulphurisation of phosphorus-containing oligo:nucleotide(s) - by contacting the containing five-membered heterocycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    06-NOV-1997

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              determination of the predisposition of a human to essential hypertension or pregnancy induced hypertension and comprises, analysing the DNA sequence of the angiotensinogen (AGT) gene for the G-6A mutation, where the presence of the mutation is indicative of a predisposition to essential or pregnancy induced hypertension. The method is useful for the molecular identification of hypertension. The mutation in the AGT gene at position -6 leads to increased plasma AGT concentrations, giving the physiological symptoms for this disease. The mutation (G to A) can be screened for using sequencing methods or hybridisation with a mutation specific primer. Previous disposition to the condition relied on inheritance analysis (ratios, calculations, etc.) between parents/siblings to determine linkage. With the method, a specific diagnosis can be made
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  IRP5; LDL-receptor related protein; TRP-3; IDDM; diagnosis; endocytosis;

AAV85827 to AAV85822 represent exon primers used for obtaining LRP5 cDNA. Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Allheimer's disease and cardiovasgular disease. New isolated LDL-receptor related protein - used to develop products treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease.
                                                                                                                                          Claim 12; Page 111; 200pp; English.
```

the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytrosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease. Products from the present invention The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). AAV85823 to AAV85900 represent SNP primers used for obtaining LRP5 CDNA. Nucleic acid molecules (NAMs) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMs or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in Sequence can also 20 BP; 5 be used for detection, diagnosis and drug screening A; 6 C; 5 G; 4 T; 0 U; 0 Other; Nucleic acid
